

How can you improve the code and refactor it?

1. Follow SOLID Principles
  - a. Divide the work of the ViewController to ViewModel, Manager, Router, Interactor etc thus following SRP.
  - b. Connect the elements using DI
  - c. Follow good practices like MVVM and CLEAN
2. Improved naming conventions for functions, variables, and classes.
3. Use dedicated methods for better organization. Animation , collectionview set up etc
4. Used guard statements for safer optional unwrapping.
5. Removed unused properties
6. Implement collection view delegate and data source methods
7. Add comments.
8. Removed redundant methods.
